Hi charvey

Please explain why the conducted power measurements in the revised report are so much lower than the peak power measurements in the original report.

- I require in company and lower output power
- Because it is to satisfy MPE

There is no documentation in the test report of the measurement using the required substitution method of EIA/TIA-603. This revised report now documents ERP of 0.851W, 0.837W and 0.743W for the 3 measured channels, but provides no information as to how these ERP values have been obtained.

- Test report attached

The responses to my first notice item #9 and my second notice item #2 have not been addressed by you.

#9 : This equipments offer with antenna and manual attached

#2 : Test report attached

Must take advantage of certificate really today.

I do not go to the house until certificate is published and will wait.

Please, ask.

thanks
